# Reasons For Allowance

Application/Control Number: 10/577,586

Art Unit: 2863

The **combination** as claimed wherein a method for reducing interferences in an electrochemical sensor comprising calculating a corrected current value representative of a glucose concentration using a measured first current, a measured second current, and a ratio of a covered area to an uncovered area of a second working electrode (claims 1, 3, 7, 9) is not disclosed, suggested, or made obvious by the prior art of record.

Davies et al. (US 2005/0133368) discloses a electromechanical sensor for reducing the effects of interfering compounds in bodily fluids (Abstract, lines 1-4) comprising a second electrode including a covered portion and an uncovered portion, the covered portion is covered by a reagent layer (claim 1, lines 9-12). However, Davies does not disclose calculating a corrected current value representative of a glucose concentration based on a ratio of the covered area to the uncovered area of the second working electrode.

Davies et al. (US 2005/0183965) claims a method comprising calculating a corrected current value representing an analyte concentration using an equation which is a function of a first current, second current, first proportional relationship between an interfering overpotential current and analyte current, and second proportional relationship between said interfering overpotential current and a compound interfering current (claim 1). However, Davies et al. does not claim calculating the corrected

current value based on a ratio of a covered area to an uncovered area of a second working electrode.
